Important Notes

Numbers have been rounded down every time.

Tree fruits are labeled Multi-Season because they survive once the season is over.

Processing days have been measured for crops that regrow by the days it takes to regrow them. Processing days have been measured for all other crops by their normal growth time.

Item Profit represents the first harvest only.

"Per Square" refers to a single square on your farm wherein only one crop can be planted at a time.

Processing days are cumulative - I count the total amount of time from planting the seed to selling the final product. This might make my numbers very different from what you expect for that section.

Seasonal Profit for Multi-Season crops represent the first season they were planted EXCEPT in the case of crops that take all season to grow (tree fruits, Ancient Fruit) in which case they represent the first season they could be harvested.
